# Final Project

On May 20th you will give a 5 minute presentation on what you have created. The primary expectation is that you produce HTML and CSS, but you may use any web technology you choose. Your project should live at a unique domain name and be hosted on a non-Parsons server (you will buy webspace).

## Milestones

These is a suggested workflow. Feel free to work at whatever pace works best for you, this is my suggestion for the best way to approach this project and what I will expect to be done at the given date.

### April 15th :: Present your concept

You will tell me what you are doing and a general plan of how you will do it. This plan will include a discussion of what technology you will use and how long it will take you. You will have purchased a domain name and will have a placeholder live on a hosted server.

### April 22 :: Markup and Content

You will show me the finished structure of your project. We will review it's overall health and try to avoid expensive mistakes.

### April 29 :: Style Structure

You will present how you will organize the style of your project. You should have created all the CSS file you'll need and you should have foundational styles finished.

### May 6 :: Style Iteration

The Majority of you CSS should be finished and your project should be completely fleshed out.

### May 13 :: Polishing

This is where you add all the details that make the project feel refined and professional. Interactions feel responsive and complete. Typography is thoughtful and consistent throughout the experience.

### May 20 :: Final Presentation

## Ground Rules

I will not review any project that contains the following

- Inline styles
- Space formatting with `<br>` tags
- Inconsistent code style

*A word about code style*

If you have no preference for code style, feel free to use mine.
